FOUNDATION REPAIR AND WATER CONTROL IN GERING, NE

Frontier Basement Solutions was contacted by a home owner with concerns of settlement shown by exterior cracking within mortar joints of the brick and interior cracking in the basement floor and sheet rock. Elevation measurements were taken throughout the home and a number of options were given to the homeowner for repairs. A decision was made to stabilize the foundation using SafeBase Push Piers, and install an interior drain tile system before completing the remodeling of the home.

1 FOUNDATION REPAIR PLAN
Scale: 1/8"=1'-0"

Gutshen Residence	Johnson Cashway	George Hill	10/10/2019	SafeBase Foundation Repair Products		

A total of 36 SafeBase Standard Duty Push Piers were installed with SaberTooth Brackets on the interior of the foundation to an average depth of 60' per pier. 170 linear feet of SafeBasements Waterproofing was also installed. The interior drain tile system consisted of SafeEdge Max and Multi-Flow drain tile with sump.

After the push piers and interior drain tile system were installed the concrete floor could be poured back into the basement, and once cured the rest of the remodeling could be completed. Now the homeowner may rest assured that the house is on a stable and dry foundation and will be for the life of the home. The project was completed in February of 2020.
